

VoltTrace | System Installation & Deployment Guide

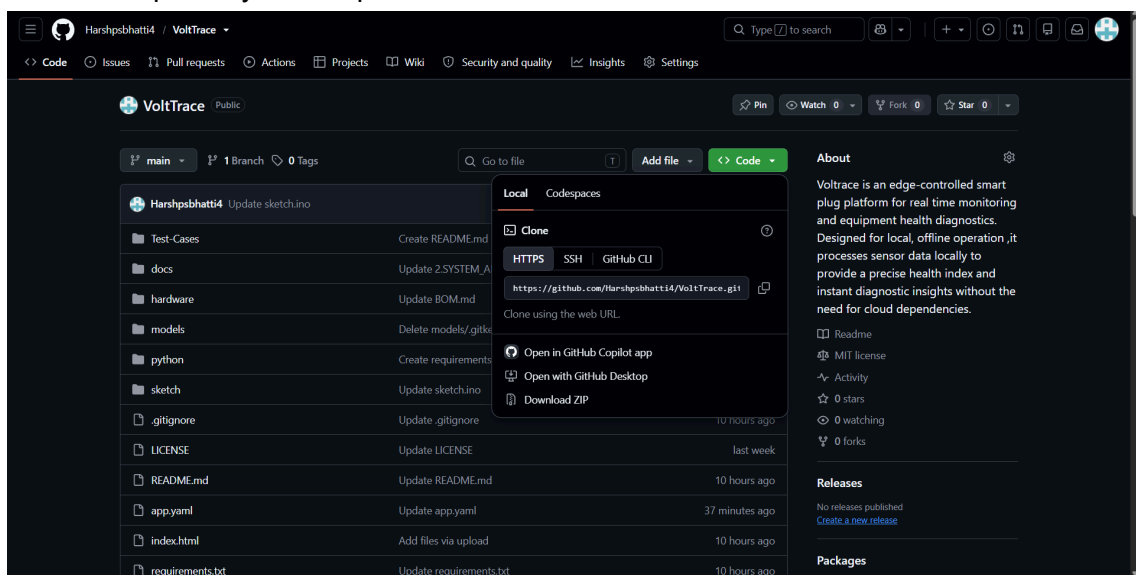

Target Platform: Arduino UNO Q (Dual-Core MCU + Linux MPU)

Before beginning, make sure you have done the connections of all sensors, ac mains and the relay as well, as given in the hardware folder.

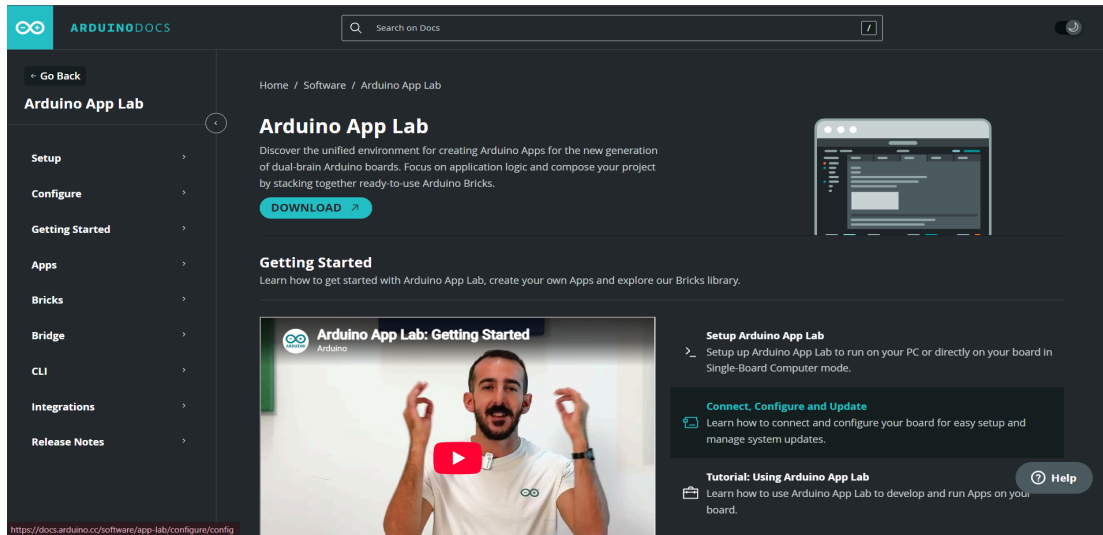

1. Navigate to the [repository link](#).

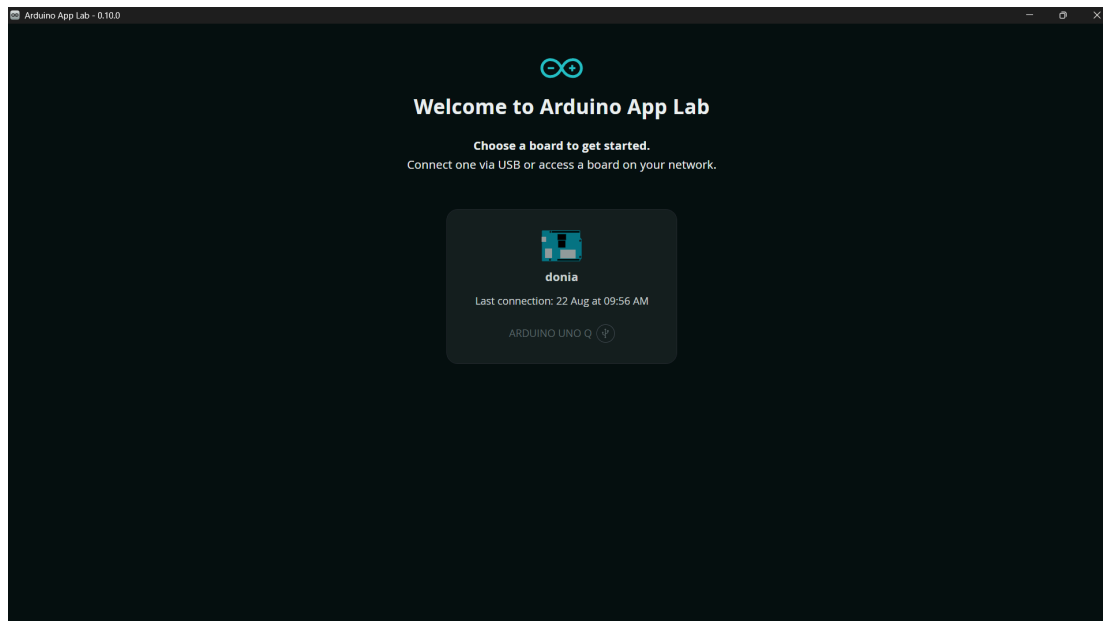

2. Download the repository as a .zip file.

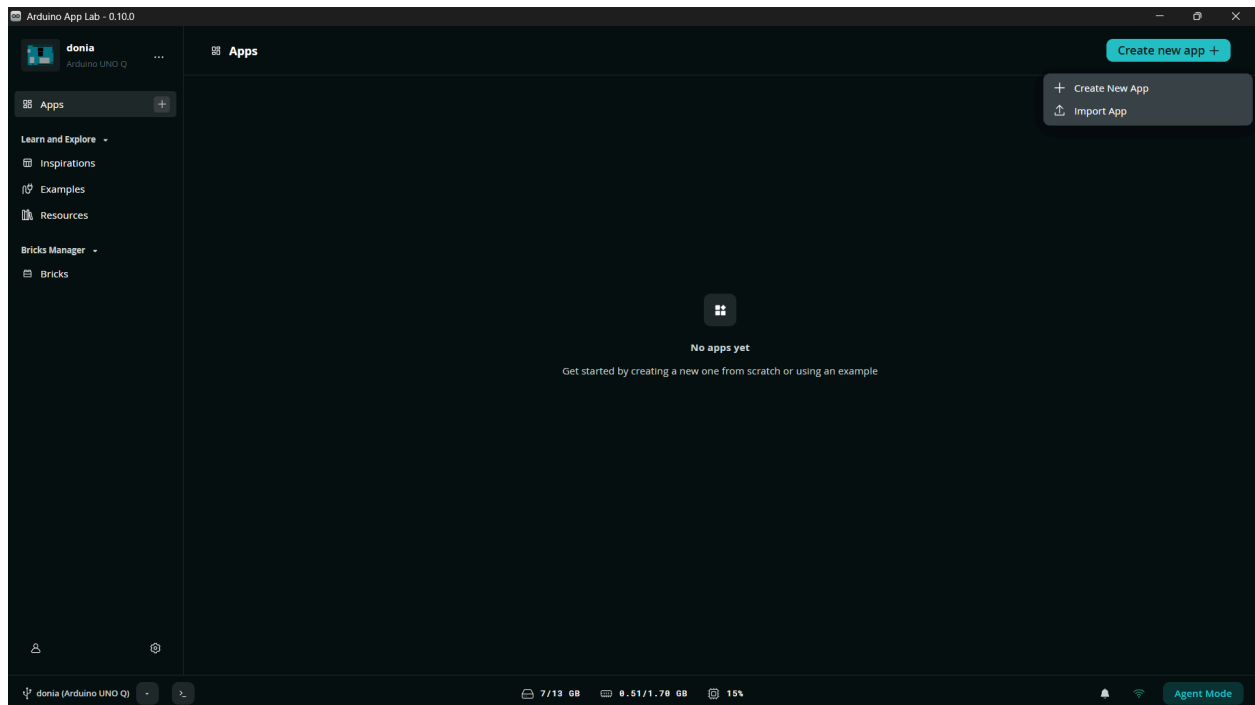

3. Download the Arduino App Lab - [Link](#).

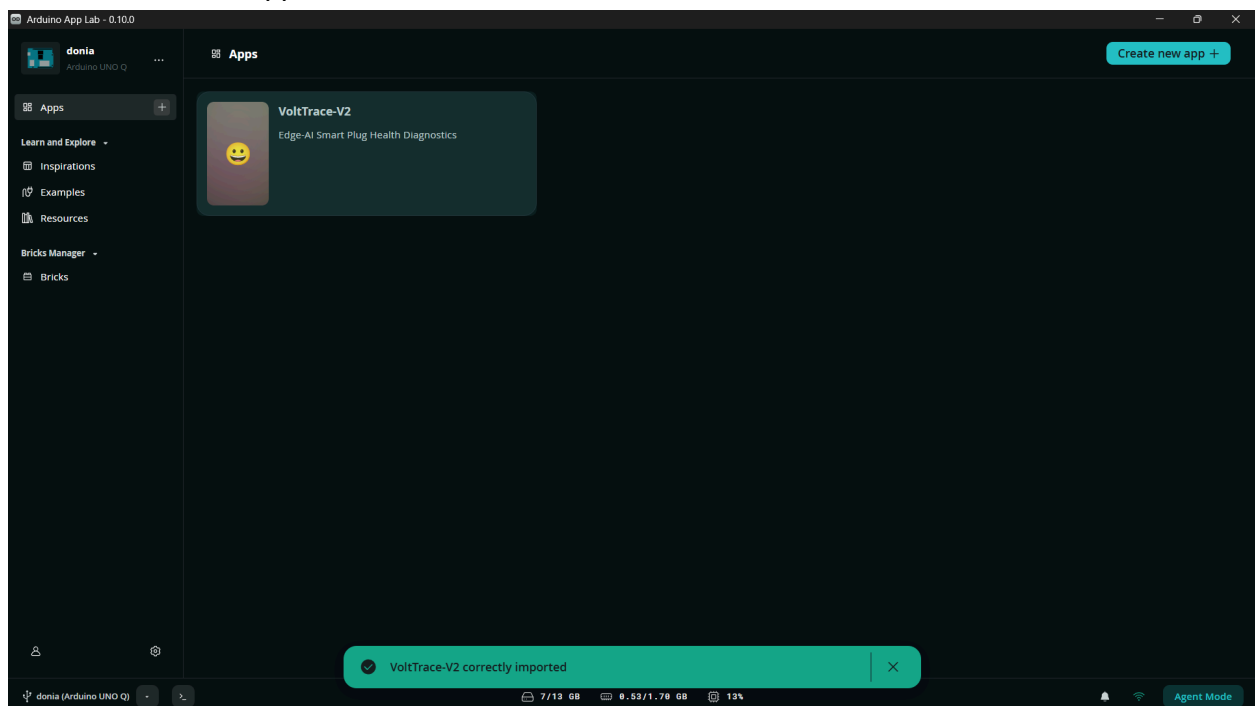

4. Connect the Arduino Uno Q and open the Arduino App Lab. Once the board is recognised click on it.

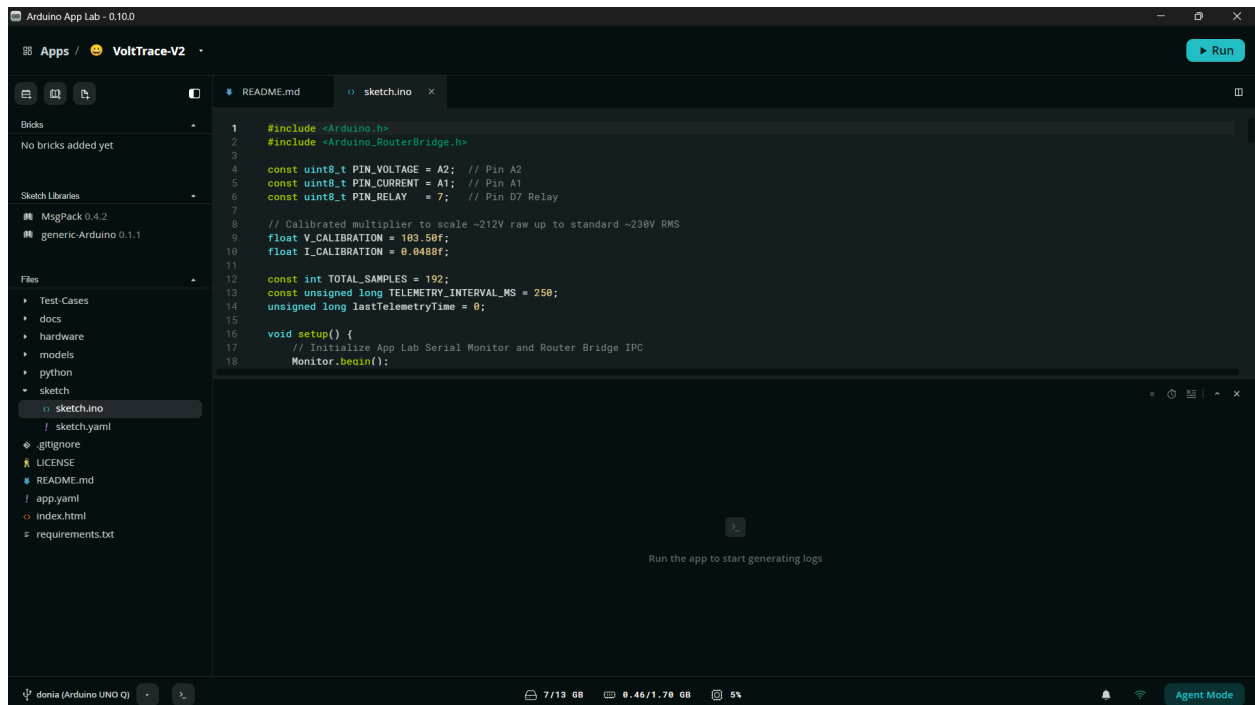

5. Under the Apps section , click create new app and next click import app.

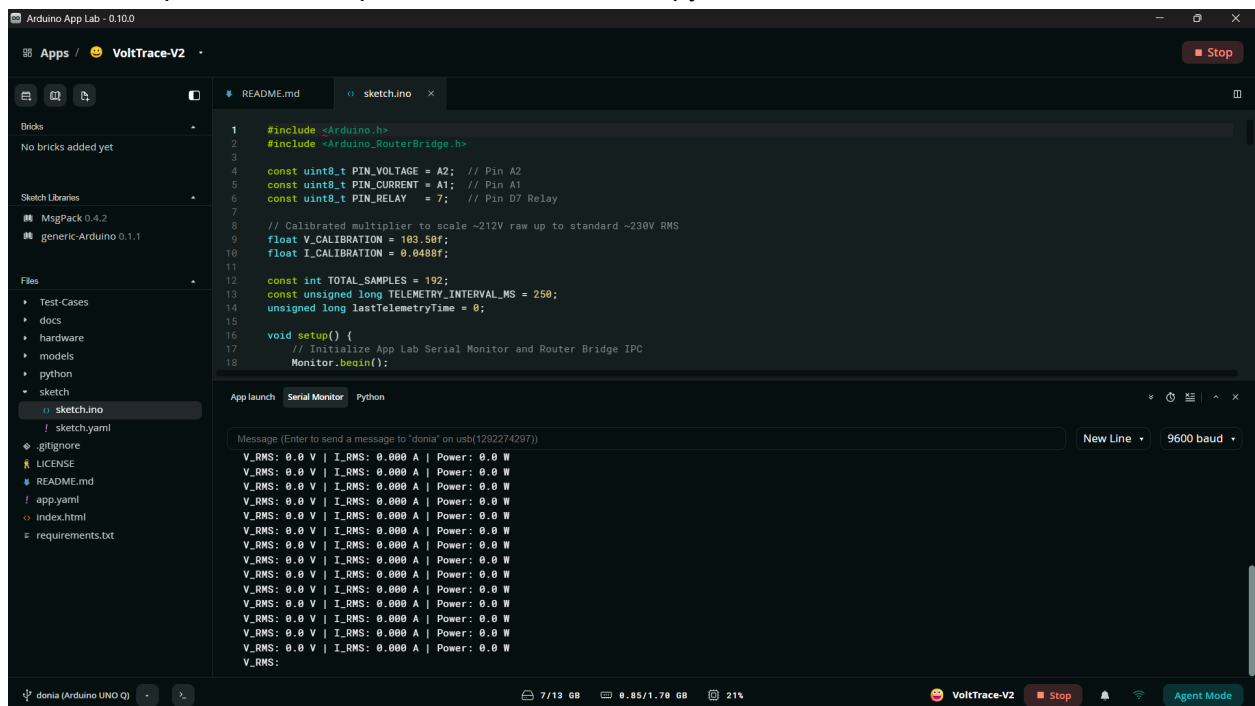

6. Browse where you hav downloaded the .zip file and select it. Once uploaded the directory will be available in the apps section.

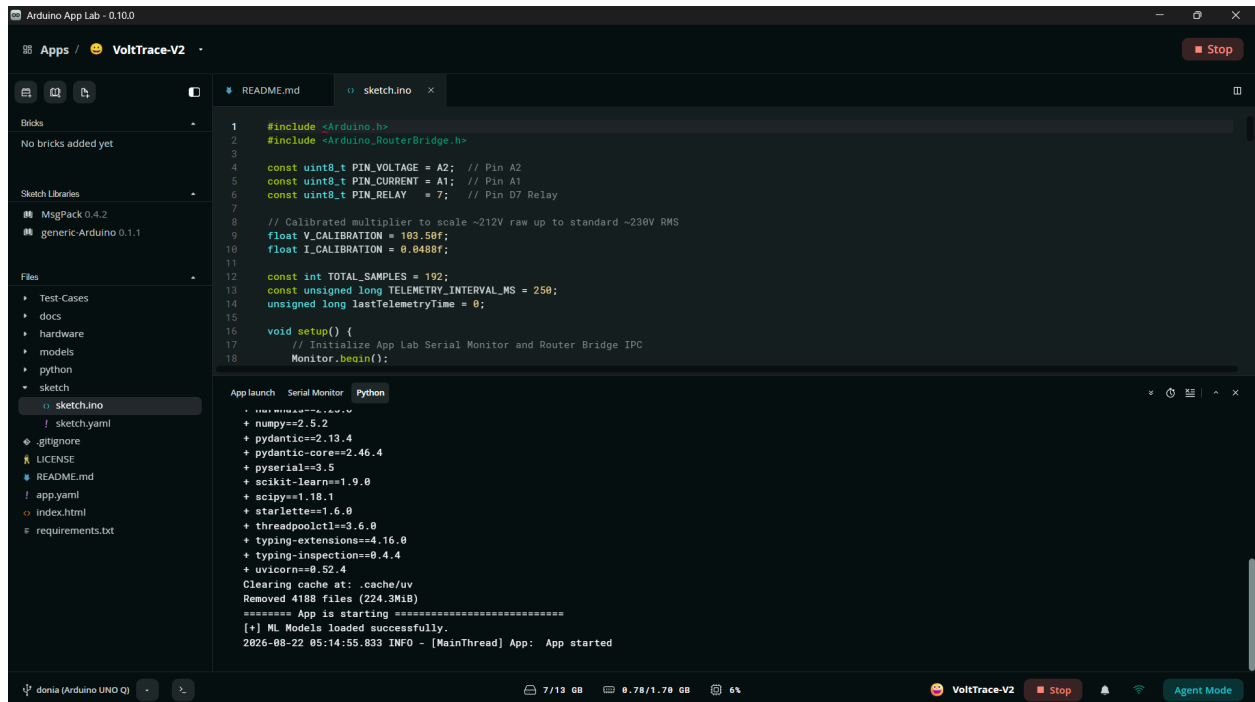

7. Open the app and hit Run.

8. Once the process is completed, we can view the python terminal and serial monitor as well.

8. Navigate to <http://127.0.0.1:7000>. Ensure the device and the arduino uno q must be on the same network in order to view the dashboard.
